Version 1.0 - October 2026
Official website: https://sln.life

Important Notice

This whitepaper is an informational document describing the SLN (□□□ / Sha Ling Niu) project, its community concept, token mechanics, public infrastructure and current development direction. It is not an offer to sell securities, a solicitation to invest, financial advice, legal advice, or a guarantee of future performance.

SLN is a meme token and crypto-assets can be highly volatile. A participant may lose some or all of the value used to acquire a token. The expressions “Killing Zeros” and “Zero Killer” are part of the project's cultural and meme identity and must not be interpreted as a promise that SLN's price will increase, reach a particular value, or generate a return.

Users should independently verify the official contract address, understand transaction taxes, review the relevant smart-contract and platform information, and consider their own financial circumstances and applicable laws before interacting with SLN.

Canonical contract: 0x61C9096bB839aC2587bcc2c2772d0bAA95dBFffF

This document does not constitute the legal memorandum that certain listing platforms may require from a qualified legal professional.

1. Executive Summary

□□□ (Sha Ling Niu), ticker SLN, is a community-driven meme token deployed on BNB Smart Chain as a BEP-20 token. The project draws its identity from Chinese internet culture and the concept of □□ (“Killing Zeros”), represented visually by a fierce red bull.

SLN is designed first as a community and meme-culture project. It does not claim to be a Layer-1 blockchain, a guaranteed-yield product, or a substitute for traditional financial infrastructure. Its public-facing model focuses on a recognizable cultural identity, transparent transaction-tax mechanics, on-chain verifiability, liquidity support, token burns, and holder distribution.

The official SLN website states that the project has no venture backers and no promised utility; its identity is intended to come from the culture that created it and the community that carries it.

Core principles: community, transparency, verifiability, security awareness, and no guaranteed returns.

2. Project Identity and Cultural Concept

2.1 What “Killing Zeros” means

Within the SLN narrative, □□ (“Killing Zeros”) describes the aspiration of watching leading zeros disappear as a number grows. For SLN, this expression functions as a meme, motto and cultural motif. It is not presented as a prediction or promise concerning token price.

2.2 The red bull

The bull is the project's central mascot and symbolizes strength, determination and the bull-market spirit commonly found in crypto culture. The project's visual language combines red, black and gold to create a recognizable identity across its website and community channels.

2.3 The Herd

SLN refers to its community as “the Herd.” Community participation can include discussion, memes, artwork, educational content, project feedback and promotion of verifiable official information.

3. Network and Token

Attribute	Current public information
Project	□□□ (Sha Ling Niu)
Ticker	SLN
Network	BNB Smart Chain
Token standard	BEP-20
Chain ID	56
Decimals	18
Total supply	1,000,000,000 SLN
Official contract	0x61C9096bB839aC2587bcc2c2772d0bAA95dBFffF

BNB Smart Chain provides the public ledger on which SLN transfers and contract activity can be independently inspected. Users should verify the complete contract address rather than relying only on the token name or ticker, because names and tickers can be duplicated.

4. Tokenomics

SLN's public tokenomics specify a 5% buy tax and a 5% sell tax. The percentages below describe how the collected 5% transaction tax is distributed. They do not describe an initial allocation of the total token supply.

Destination	Share of collected tax	Effective share of taxable trans
Holder distribution	30%	1.5%
Liquidity	30%	1.5%
Token burn	20%	1.0%
Project funds recipient wallet	20%	1.0%
Total	**100%**	**5.0%**

Example: for a hypothetical taxable transaction of 1,000 units, a 5% tax corresponds to 50 units. Under the stated distribution, 15 units would correspond to holder distribution, 15 to liquidity, 10 to burn and 10 to the project funds recipient wallet.

5. Burn and Holder Distribution

5.1 Token burn

The published tax model allocates 20% of the collected transaction tax - equivalent to approximately 1% of each taxable transaction - to token burn. Tokens sent to a recognized burn/dead address are intended to be removed from usable circulation.

The official website currently displays a live burn counter sourced from public BNB Smart Chain data. At the time this whitepaper was prepared, that counter displayed 0 SLN burned. Future burn figures should be treated as on-chain facts only when independently verifiable.

5.2 Holder distribution

The published tax model allocates 30% of the collected transaction tax - approximately 1.5% of each taxable transaction - to holder distribution. Actual receipt and eligibility depend on the token's implemented mechanics and the relevant on-chain state.

5.3 Liquidity

Thirty percent of the collected tax - approximately 1.5% of a taxable transaction - is designated for liquidity. Liquidity supports market trading but does not eliminate price volatility, slippage, smart-contract risk or the possibility of loss.

5.4 Project funds recipient wallet

Twenty percent of the collected tax - approximately 1% of a taxable transaction - is designated for the project funds recipient wallet to support ecosystem operations and growth.

6. Trading and Access

SLN was launched through Four.meme on BNB Smart Chain. At the current stage, Four.meme is presented by the project as its primary trading and launch platform. Four.meme is a public, permissionless meme-token platform; the presence of SLN on the platform should not be interpreted as an endorsement by Four.meme.

Official Four.meme token page:
https://four.meme/en/token/0x61c9096bb839ac2587bcc2c2772d0baa95dbffff

Users should access trading venues through official project links, confirm the BNB Smart Chain network, verify the complete SLN contract address and review transaction details before signing.

7. Community and Governance Direction

SLN is currently led by its founder/core contributor, who is responsible for project vision, tokenomics coordination, launch activities, website and communications, community development, listing applications and broader ecosystem growth.

The project describes itself as community-driven. This whitepaper does not claim that SLN currently has formal decentralized governance, a DAO, institutional investors, venture-capital backing or formally appointed external advisors unless such information is subsequently announced and verifiable through official channels.

8. Roadmap

Phase 1 - Launch & Ignition

Token launch on BNB Smart Chain, initial community formation and opening of official channels.

Phase 2 - Community Expansion

Community growth through content, memes, community activity and wider ecosystem visibility.

Phase 3 - Tracking & Integrations

Applications to tracking platforms and integrations intended to improve transparency and access.

Phase 4 - Community-Driven Development

Future direction shaped with community participation. Milestones should be announced when completed rather than represented prematurely as achievements.

9. Transparency and Security

Contract verification

Always compare the full contract address with the address published on the official SLN website.

Wallet security

The SLN project should never require a user's seed phrase, private key or recovery phrase.

On-chain verification

Token supply, transfers, burns and other contract activity should be independently checked using BNB Smart Chain block-explorer data where applicable.

No fabricated metrics

If reliable price, market-cap, volume or holder-count data is unavailable, the project should avoid publishing invented figures.

Official-channel consistency

Website, X, Telegram, Four.meme and block-explorer references should consistently point to the same canonical SLN contract.

10. Risks and Limitations

• Market risk: meme tokens can experience extreme price volatility and loss of value.

• Liquidity risk: available liquidity may change and may be insufficient for a desired trade size.

• Smart-contract risk: software defects, unexpected behavior or dependencies can create losses.

• Platform and infrastructure risk: wallets, RPC providers, trading platforms and third-party services may fail or change.

• Regulatory risk: laws and regulatory treatment of crypto-assets vary by jurisdiction and can change.

• Tax-mechanism risk: transaction taxes affect execution and should be understood before trading.

• Community/project risk: roadmap items are objectives, not guarantees of completion or adoption.

• Impersonation risk: malicious actors may create fake tokens, websites or social accounts using the SLN name.

Nothing in this document guarantees profitability, price appreciation, exchange listings, partnerships, future integrations or continued availability of any third-party service.
